DO NOT FORGET TO RECORD YOUR SCREEN

Use the entry ticket as the base and make the following changes:

- When the user adds a new item to the shopping list, also read the price of the item and how many of that item to buy.
- After all the information about an item (name, price, count) has been entered the total price for that item shall be calculated (price * count) and added to a variable keeping track of the total cost of all items combined.
- When the user selects the third option from the menu indicating that he or she is finished with adding more items, the total cost for all items combined shall be printed to the screen together with the final shopping list.
- Use two decimal places and the format below when printing the total cost:

  ```
  Total cost: 500.00 SEK
  ```

NOTE: The new information read from the user (price and count) shall **not** be added to the string containing all the items on the shopping list.

Group discussions

Students who pass the supplementary task will be divided into smaller random groups where the students shall *discuss* and *take notes* about the entry ticket, the supplementary task, and the design of the previously mentioned parts.

Students shall focus on the following topics:

1) What were the most important parts of the problem description for the following?

    a. The entry ticket.

    b. The supplementary task.

2) Create a detailed and accurate flowchart using the correct symbols that illustrates how to solve the entry ticket (excluding the supplementary task).

3) Have each group member briefly present his or her implementation, then discuss and compare the implementation details. Focus on both similarities and differences.

4) Discuss what parts of the examination that were the trickiest and why they were perceived this way. Select one tricky part and discuss how it was solved and what can be done to avoid similar problems in the future.
