DO NOT FORGET TO RECORD YOUR SCREEN

Use the entry ticket as the base and make the following changes:

- Create a counter variable that is initially assigned the integer value 0.
- Extend what happens when the user adds a new item to the shopping list so that it does not only add the new item to the string, but it also increases the counter variable by one.
- Add a new menu option called **Show number of added items** that prints how many items has currently been added to the shopping list. The user shall be able to pick the new menu option using the letter **S** when selecting a menu option.
- Use the following format when printing the number of items on the list:

```
Currently the list contains 5 item(s)
```

NOTE: The formatting of the final shopping list shall remain the same, it shall not print the number of items added. One shall only be able to see the number of added items if one uses the new menu option.

Group discussions

Students who pass the supplementary task will be divided into smaller random groups where the students shall *discuss* and *take notes* about the entry ticket, the supplementary task, and the design of the previously mentioned parts.

Students shall focus on the following topics:

1) What were the most important parts of the problem description for the following?
    a. The entry ticket.
    b. The supplementary task.
2) Create a detailed and accurate flowchart using the correct symbols that illustrates how to solve the entry ticket (excluding the supplementary task).
3) Have each group member briefly present his or her implementation, then discuss and compare the implementation details. Focus on both similarities and differences.
4) Discuss what parts of the examination that were the trickiest and why they were perceived this way. Select one tricky part and discuss how it was solved and what can be done to avoid similar problems in the future.
