DO NOT FORGET TO RECORD YOUR SCREEN

Use the entry ticket as the base and make the following changes:

- Add a new menu option called **Calculate price**. The user shall be able to pick the new option using the letter **C** when selecting a menu option.
- The new menu option shall be a calculator where the user is asked to enter the price of three items and then the total price for the three items shall be printed to the screen.
- A **for-loop** shall be used when asking the user for the three prices. Each iteration in the loop shall read an integer value (the price of one item) and add it to a variable keeping track of the total price.
- After having calculated the total price, it shall be printed to the screen using the following format:

  ```
  Total price:    45 SEK
  ```

  The calculated total price shall be right aligned and have a minimum width of 5 characters.

NOTE: What it looks like when the three prices are read, the formatting of the question, is not important. To important thing is that three prices are read using a for-loop.

Group discussions

Students who pass the supplementary task will be divided into smaller random groups where the students shall *discuss* and *take notes* about the entry ticket, the supplementary task, and the design of the previously mentioned parts.

Students shall focus on the following topics:

1) What were the most important parts of the problem description for the following?
    a. The entry ticket.
    b. The supplementary task.
2) Create a detailed and accurate flowchart using the correct symbols that illustrates how to solve the entry ticket (excluding the supplementary task).
3) Have each group member briefly present his or her implementation, then discuss and compare the implementation details. Focus on both similarities and differences.
4) Discuss what parts of the examination that were the trickiest and why they were perceived this way. Select one tricky part and discuss how it was solved and what can be done to avoid similar problems in the future.
