DO NOT FORGET TO RECORD YOUR SCREEN

Use the entry ticket as the base and make the following changes:

- Add two new integer variables called *count* and *total_cost*. Initialize both variables to zero.
- When a new item is added to the shopping list the user shall be asked not only to enter the name of the item but also its *price*.
- The *price* shall be read as an integer value, and it shall be added to the *total_cost* variable that is keeping track of the total cost for all items on the shopping list.
- For each new item added to the shopping list the *count* variable shall be incremented by one.
- After displaying the finished shopping list (menu option 3) the average price of all the items on the shopping list shall be printed to the screen using two digits after the decimal point. Use the following format:

```
Average price: 137.50 SEK
```

NOTE: The average price is calculated as the total price / how many items there are on the shopping list.

Group discussions

Students who pass the supplementary task will be divided into smaller random groups where the students shall *discuss* and *take notes* about the entry ticket, the supplementary task, and the design of the previously mentioned parts.

Students shall focus on the following topics:

1) What were the most important parts of the problem description for the following?

    a. The entry ticket.

    b. The supplementary task.

2) Create a detailed and accurate flowchart using the correct symbols that illustrates how to solve the entry ticket (excluding the supplementary task).

3) Have each group member briefly present his or her implementation, then discuss and compare the implementation details. Focus on both similarities and differences.

4) Discuss what parts of the examination that were the trickiest and why they were perceived this way. Select one tricky part and discuss how it was solved and what can be done to avoid similar problems in the future.
