DO NOT FORGET TO RECORD YOUR SCREEN

Use the entry ticket as the base and make the following changes:

- Add a new float variable called *highest_price* that will be used to keep track of the most expensive item on the shopping list. Initialize the variable to zero.
- When adding a new item to the shopping list the user shall be asked not only to enter the name of the item but also its *price*. The *price* can be a floating point number.
- If the new item is more expensive than all other items on the shopping list, then the new *price* shall be stored in the variable *highest_price*.
- After displaying the finished shopping list (menu option 3) the price of the most expensive item on the shopping list shall be printed to the screen using three digits after the decimal point. Use the following format:

```
Most expensive item: 137.500 SEK
```

NOTE: When adding the first item to the shopping list it will always be considered the most expensive item, and its price shall be recorded in *highest_price*.

Group discussions

Students who pass the supplementary task will be divided into smaller random groups where the students shall *discuss* and *take notes* about the entry ticket, the supplementary task, and the design of the previously mentioned parts.

Students shall focus on the following topics:

1) What were the most important parts of the problem description for the following?

    a. The entry ticket.

    b. The supplementary task.

2) Create a detailed and accurate flowchart using the correct symbols that illustrates how to solve the entry ticket (excluding the supplementary task).

3) Have each group member briefly present his or her implementation, then discuss and compare the implementation details. Focus on both similarities and differences.

4) Discuss what parts of the examination that were the trickiest and why they were perceived this way. Select one tricky part and discuss how it was solved and what can be done to avoid similar problems in the future.
